

Tool for Visual Cluster Analysis and Consensus Clustering

Christian Permann

Faculty of Computer Science, University of Vienna,
Währinger Straße 29, 1090 Vienna

12.05.2020

Introduction

Clustering:

- ▶ Grouping data-points such that their underlying relationships are reflected
- ▶ Gaining knowledge through this grouping

The process of clustering is not done when a solution is computed,
but when the researcher involved:

“... **evaluated**, **understood** and **accepted** the patterns.” (Chen and Liu [2])

Challenges:

- ▶ Many possibilities for clustering:
 - ▶ Algorithms/Parameters/Assumptions
- ▶ Choice and interpretation of solution is difficult

Related Work: Clustering

There is a vast amount of clustering techniques, including:

- ▶ Partition-based methods (KMeans-like algorithms)
- ▶ Hierarchy-based methods (e.g. Joining of Sets/Linking)
- ▶ Density-based methods (e.g. DBSCAN/OPTICS)
 - ▶ Many more...

Related Work: Visual Frameworks

- ▶ ClusterVision
 - ▶ Ranking solutions according to a combination of quality metrics
 - ▶ Choosing from the highest ranked ones
- ▶ VISTA
 - ▶ In-depth analysis of individual solutions
 - ▶ Possibilities for relabeling of points (ClusterMap)
- ▶ Simple Visualizations
 - ▶ Included in most data-analysis tools
 - ▶ Scatter plots, bar charts, etc.

Related Work: Consensus Clustering

Combining clustering results may yield a better solution:

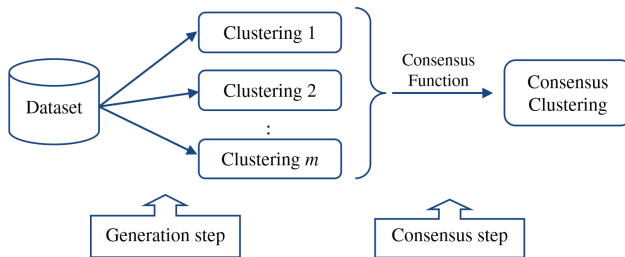

Figure 1: Workflow for generating consensus clusterings [5, p. 340]

Idea of our Tool: Facilitating clustering exploration

How can we assist users in exploring clustering results?

- ▶ Visualizing individual results
 - ▶ Scatter plot (matrices)/kernel density estimation
 - ▶ Dimensionality reduction
- ▶ Visualizing similarities between results
 - ▶ OPTICS meta-clustering
 - ▶ Heat maps
 - ▶ Multi-Dimensional-Scaling to approximate solution space

Idea of our Tool: Gathering more Information

Can we gain additional knowledge from multiple computed solutions?

- ▶ Previous frameworks only try to select the best one
 - ▶ Additional information lost
 - ▶ Difficult to objectively identify best one
- ▶ Consensus clustering
 - ▶ Can combine solutions or groups of solutions

Idea:

- ▶ Combine group of robust solutions into one

The Tool

Three main parts:

- ▶ Data-View
 - ▶ Loading/Saving/Creating data
 - ▶ Cleaning up data
 - ▶ Visualizing data
- ▶ Workflow-View
 - ▶ Creating clustering workflows
 - ▶ Defining parameters
- ▶ Meta-View
 - ▶ Visualizing clusterings and meta-clusterings
 - ▶ Selecting or creating final results (& consensus clustering)

Aim: Facilitating use through clear separation

The Tool: Data-View

Figure 2: Data-View

The Tool: Data-View - Scatter Plot Matrix

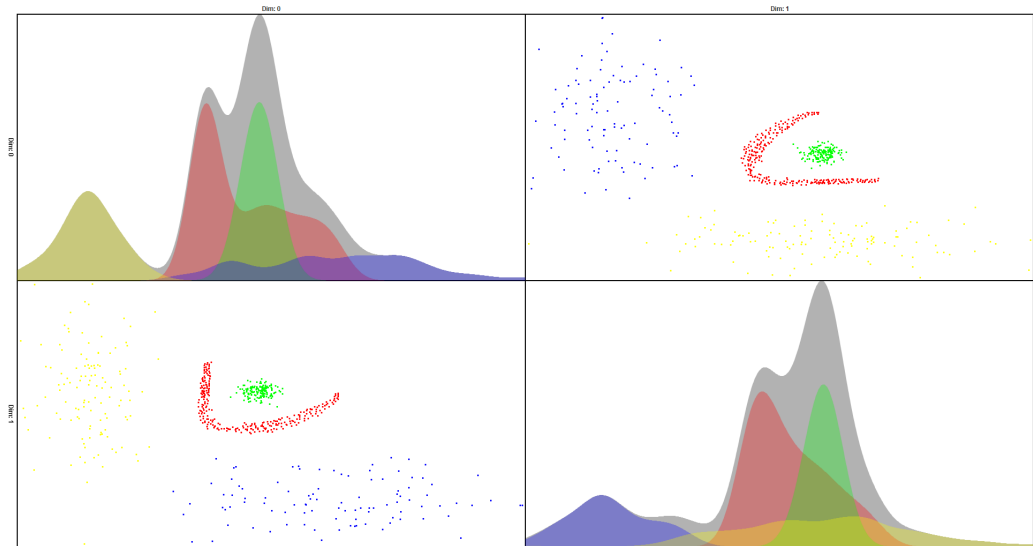

Figure 3: Scatter Plot Matrix

The Tool: Workflow-View

The screenshot shows a window titled "Workflow-View" with standard window controls (minimize, maximize, close) in the top right corner. The interface is divided into several sections:

- Add:** A dropdown menu currently showing "DBScan".
- Workflow:** A list of steps in the workflow, each with a small "X" icon to its left:
 - LloydKMeans: k(LB:2 UB:10) Samples each(3)
 - MacQueenKMeans: k(LB:2 UB:10) Samples each(4)
 - DBScan: minPTS(LB:3 UB:20) Epsilon(LB:0.2 UB:2.0 Samples(100))
- minPTS Parameters:** Located on the right side, with input fields for:
 - minPTS: 1
 - lower bound: 1
 - upper bound: 1
- epsilon Parameters:** Also on the right side, with input fields for:
 - epsilon: 1
 - lower bound: 1
 - upper bound: 1
- Samples:** An input field containing the value 1.
- Bottom Section:** Contains several controls:
 - MinPts: input field with value 2
 - Seed: input field with value 5
 - ☐ Add ground truth
 - ☐ Keep trivial solutions
 - ☒ Add trivial solutions
 - Variation of Information: dropdown menu
 - Buttons: "Waiting", "Execute Workflow", "Confirm", "Load Wf", and "Save Wf".

Figure 4: Workflow-View

The Tool: Meta-View

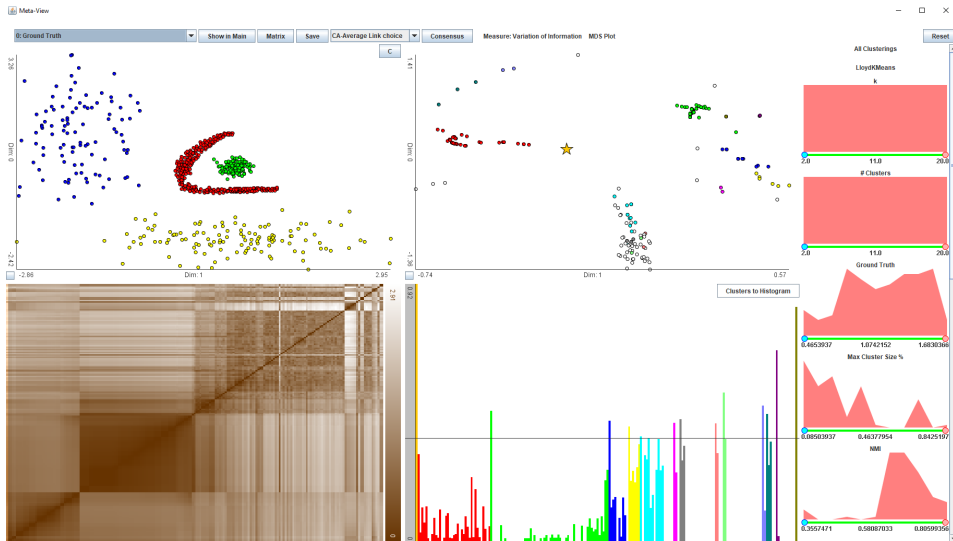

Figure 5: Meta-View

Recoloring Clusterings for Comparison

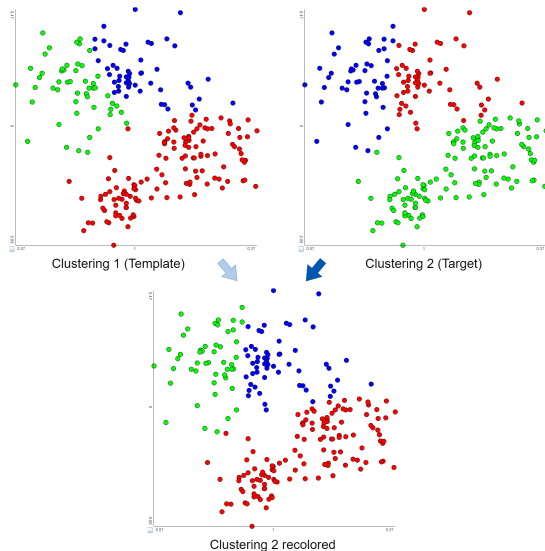

Figure 6: Depiction of Hungarian's Method

Implementation

Used tools:

- ▶ Java 1.8, utilizing Streams for parallelization
- ▶ Libraries:
 - ▶ ELKI [1] - Clustering
 - ▶ WEKA [3] - IO
 - ▶ Java Smile [4] - Additional Methods
- ▶ Swing's JComponents and overriding the *draw()* method

Ease of extension:

- ▶ All selectable methods provide simple interfaces

Tests: Introduction

We want to show that with our tool we can:

- ▶ Produce solutions better than any individual clustering result
- ▶ Obtain solutions unobtainable by single methods
- ▶ Find multiple alternative solutions which can be analyzed to find a fitting choice

And do so in a straightforward and useful way:

- ▶ Letting a user test our tool
- ▶ Also showing real world test data-sets

Tests: Better than individual Solutions

Figure 7: Synthetic Data with Ground Truth

Tests: Better than individual Solutions

Best individual result when sampling Lloyd's k-Means algorithm with $k = 2 \dots 20$ and 6 samples per k :

Figure 8: Result of best k-Means run for example Data-Set

Combining all solutions finds the ground truth exactly (without defining k)

Tests: Unobtainable Solutions

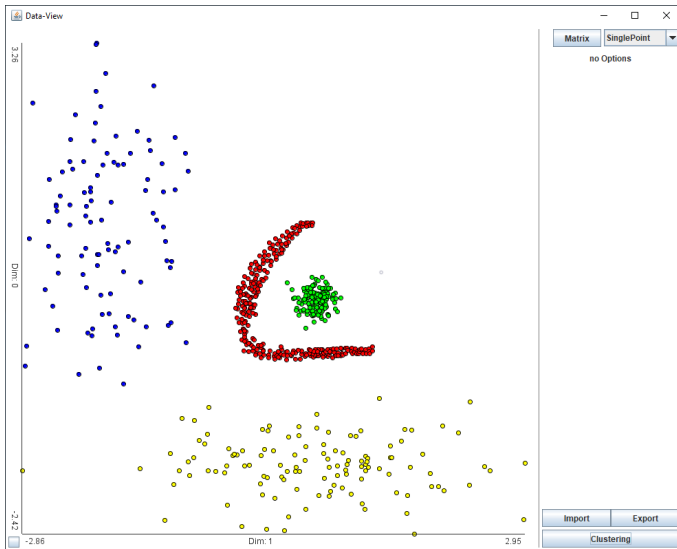

Figure 9: Synthetic Data with Ground Truth

Tests: Unobtainable Solutions

Workflow:

- ☒ LloydKMeans: k{LB:2 UB:20} Samples each{5}
- ☒ DBScan: minPTS{LB:5 UB:5} Epsilon{LB:0.01 UB:0.5} Samples{100}

Figure 10: OPTICS reachability plot

Tests: Unobtainable Solutions

(a) K-Means with $k = 3$

(b) K-Means with $k = 4$

(c) K-Means with $k = 5$

(d) DBSCAN, best single Result

(e) Selected robust Clustering

(f) Consensus Result

Figure 11: Single Clustering results for Data-Set

Tests: Multiple Solutions

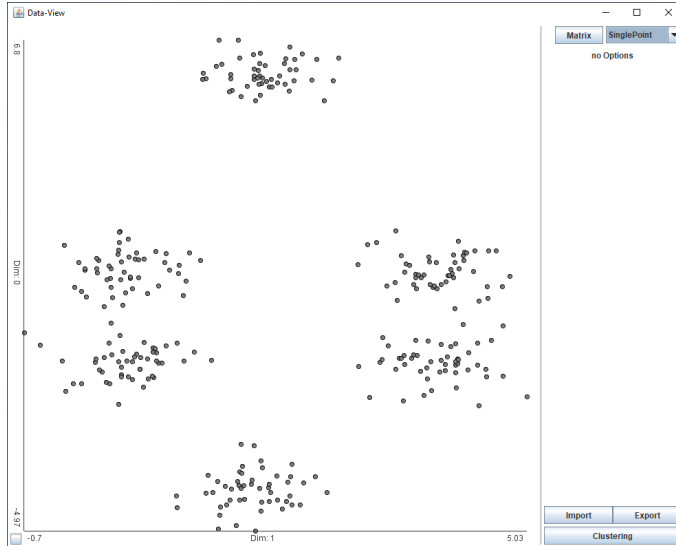

Figure 12: Example Data-Set with unknown Labels

Tests: Multiple Solutions

Figure 13: OPTICS Plot

Tests: Multiple Solutions

(a) Blue Cluster (19 base clu.)

(b) Light-blue Cluster (14 base clu.)

(c) Pink Cluster (9 base clu.)

(d) Yellow Cluster (8 base clu.)

Figure 14: Consensus Clustering results

Tests: User & Real world data

Figure 15: WiFi Localization Data-Set with first two Dimensions shown

Tests: User & Real world data

Figure 16: OPTICS Plot for WiFi Localization Data-Set

Tests: User & Real world data

(a) User Consensus Result:
NMI: 0.9142
blue (largest) Meta-Cluster

(b) Best Result of single Clustering Run
NMI: 0.8904

Figure 17: Clustering results for WiFi Localization Data-Set

Tests: Finding a good Sampling Range

- ▶ User testing on QCM3 data-set (different alcohols passed through sensors)
- ▶ Sampling with K-Means Algorithm, 10 samples per k

(a) K-Means results with: $k = 2..20$
($k > 10$ grayed out)

(b) K-Means results with: $k = 2..10$

Figure 18: OPTICS Plots for different Sampling Ranges

Future Work

Further evaluating usability:

- ▶ Additional study on usability
- ▶ Gathering information on which parts are especially useful
- ▶ Evaluating alternative views and functionality

Research on consensus clustering:

- ▶ Analysis of generation/selection mechanisms
- ▶ Evaluation of selection criteria (is there a better choice than robustness)

Conclusion

- ▶ We created a new visual tool for cluster analysis:
 - ▶ Visualizing clusterings on a meta-level
 - ▶ Showing groups of robust clusterings
 - ▶ Allowing to find solutions using consensus clustering
- ▶ We showed:
 - ▶ Robust groups indicate good results
 - ▶ Combined results facilitate choice and can be better than any individual result
- ▶ Link to the tool:
